## MY\_PING MODULE

my\_ping.py

Python implementation of ping command that tests network connectivity. Sends ICMP echo requests and measures round-trip time.

**Usage:**

python my\_ping.py [-c COUNT] [-i WAIT] [-s PACKETSIZE] [-t TIMEOUT] destination

my\_ping.**handle\_interrupt**(*signum, frame, sent\_count, received\_count, rtts, destination*)

Handle Ctrl+C interrupt. Print statistics and exit gracefully.

**Parameters:**

signum: Signal number frame: Current stack frame sent\_count: Total packets sent received\_count: Total responses received rtts: List of round-trip times destination: Target hostname or IP

my\_ping.**main**()

Parse command line arguments and execute ping. Sends ICMP echo requests and displays results.

my\_ping.**print\_stats**(*sent\_count, received\_count, rtts, destination*)

Print ping statistics summary.

**Parameters:**

sent\_count: Total number of packets sent received\_count: Total number of responses received rtts: List of round-trip times in milliseconds destination: Target hostname or IP

my\_ping.**send\_ping**(*dest\_ip, timeout, packet\_size, sent\_count, received\_count*)

Send a single ping and wait for the response.

**Parameters:**

dest\_ip: Destination IP address timeout: Maximum wait time for response packet\_size: Size of ICMP payload in bytes sent\_count: Number of packets sent so far received\_count: Number of responses received so far

**Returns:**

tuple: (success\_bool, rtt\_ms)

## MY\_TRACEROUTE MODULE

`my_traceroute.py`

Python implementation of traceroute command that maps network path to destination. Sends UDP probes with incrementing TTL values to discover intermediate routers.

**Usage:**

`sudo python my_traceroute.py [-n] [-q NQUERIES] [-S] [-f FIRST_TTL] [-m MAX_TTL] [-w WAIT] destination`

`my_traceroute.main()`

Parse command line arguments and execute traceroute. Shows network path to destination with response times for each hop.

`my_traceroute.send_probe(send_socket, recv_socket, dest_ip, ttl, port, timeout)`

Send a single traceroute probe and wait for response.

**Parameters:**

`send_socket`: Socket for sending UDP probes `recv_socket`: Socket for receiving ICMP responses `dest_ip`: Destination IP address `ttl`: Time-to-live value for this probe `port`: UDP destination port `timeout`: Maximum wait time for response

**Returns:**

tuple: (`responding_ip`, `elapsed_time_ms`) or (None, None) on timeout
